Name	Pacific Sea Level Extremes Outlooks Products
Capability Area	- Understanding Climate Variability and Change
Focus Area	- Coastal Inundation/Sea Level Rise, Extreme Weather, and Community Resilience
Regions	- Central North Pacific - Western North Pacific - South Pacific - Pacific Basin
Products/Phys ical	 - Products - Physical - Outloooks (monthly to annual) - Impacts - Flooding/Inundation - Eroison - Spatial Scale - Location/Site - Time Scale - Future - Methodology - Model/Statistical - Oceanic (e.g., Water Temperature, Salinity, Acidity, Sea Level, Wave Height)
Sectors	- Public Health and Safety - Community Planning and Development

Description	The objective of this effort is to build upon seasonal sea level
	outlooks currently provided by the NWS Pacific ENSO Applications Climate Center as well as similar types of
	information being provided by other agencies, institutions, and
	organizations in the Pacific Islands region. The goal is to
	provide information to planners, managers, and other
	decision-makers that affords them an opportunity to appropriately address risks from elevated water levels.
	Extreme water levels are experienced when seasonal high
	tides combine with intra-annual sea level variations
	associated with ocean processes (e.g., ENSO, mesoscale eddy events) and surge and/or high run-up due to wind, wave,
	and atmospheric forces associated with storms. Recent work
	suggest that not only can stations can be grouped regionally
	into those where high tides dictate extremes, where the
	combination of high tides and the nontidal residual is important, and where nontidal residual events are the primary
	cause of extreme levels, but by the combination of processes
	that contribute to the nontidal residual (e.g., tropical and extra-
	tropical storms, ocean mesoscale variability, and swell events from distant storms). This effort is exploring how this
	knowledge can be used, for example by establishing forecast
	skill through statistical relationships to teleconnections or
	other such indices, to create one to three month extreme
	water level outlooks that are specific to a particular location.
